

Firewall

Connect, Protect & Prevent

Secure your future:

It's a mild understatement to say that network and data security is now an essential part of every business. Even small to medium-sized organizations are at significant risk and are often without sufficient defense.

Firewalls are vital for protecting networks and data from threats, both internal and external. As they act as virtual walls that separate networks from the internet; Firewalls filter traffic, restrict access to internal networks, and prevent threats such as denial-of-service (DoS) attacks.

Thus, it's crucial that companies, ensure that they have the right firewall, that match they current and future needs. As without an effective firewall in place, a network could be vulnerable to breaches and other malicious threats that could end up costing your business not only a lot of money, but customers as well.

Top priorities when choosing a Firewall:

- **Current & Future needs:** It's important to factor in the growth projection & future needs for cloud applications.
- **Company size:** The needs differs depending on On-Site / Remote users, Staff functions & application needs
- **Protection:** Ability to prevent threats such as denial-of-service (DoS) & distributed denial-of-service (DDoS) attacks.
- **Simplify Security Infrastructure:** Adding complexity to security, increases the vulnerability. Taking advantages of the newest technologies, has not only become affordable, but will also allow for simplification.
